Understanding Performance

The Power Wall

Concluding Remarks

INTRODUCTION

THE COMPUTER REVOLUTION

WHAT IS A COMPUTER?

A computer is a general purpose device that can be programmed to carry out a finite set of arithmetic or logical operations.

- We use programs, i.e. sequences of instructions, to solve problems.
- The Operating System help us to code and execute our programs.

CLASSES OF COMPUTERS

Desktop computers

- General purpose, variety of software, graphics display, keyboard and mouse
- Subject to cost/performance tradeoff

Server computers

- Network based
- High capacity, dependability, security

Supercomputers

- Hundreds to thousands processors, terabytes of memory, petabytes of storage
- High performance, cost

Embedded computers

- Hidden as components of systems
- Stringent power/performance/cost constraints

EVOLUTION OF PROCESSORS FOR DESKTOPS AND LAPTOPS

Intel 80286 (1982)
 134×10^3 transistors
12 Mhz, 68,7 mm²

Intel Pentium (1993)
 3.1×10^6 transistors
66 Mhz, 264 mm²

Intel Pentium III (1999)
 28×10^6 transistors
733 Mhz, 140 mm²

Intel 80386 (1985)
 275×10^3 transistors
33 Mhz, 104 mm²

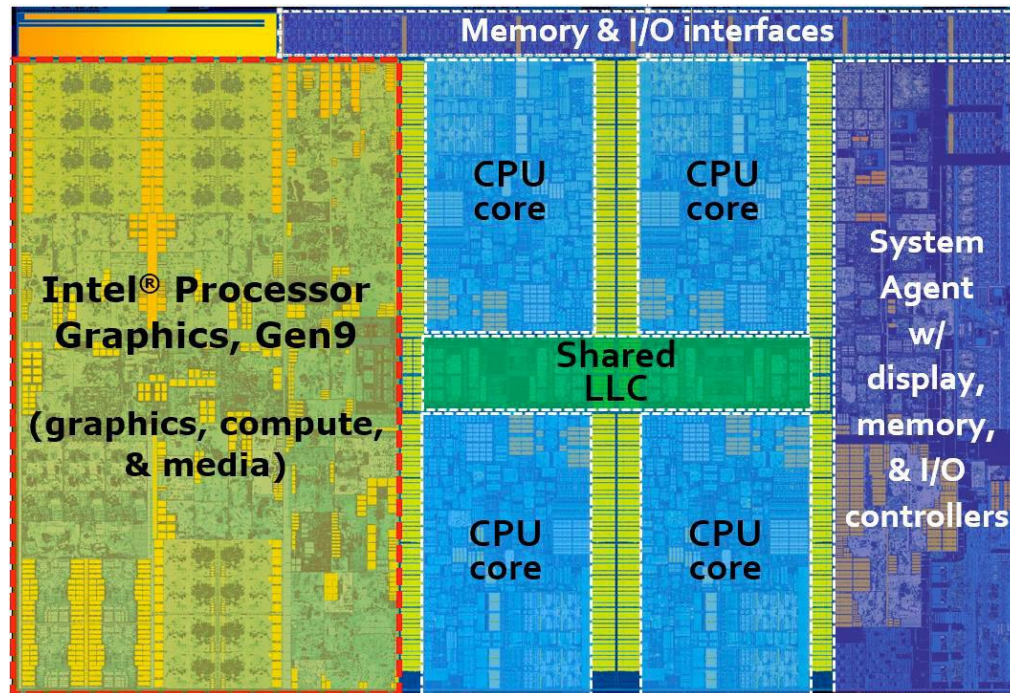

Intel Pentium II (1997)
 7.5×10^6 transistors
300 Mhz, 209 mm²

Intel Pentium 4 (2000)
 42×10^6 transistors
1.5 Ghz, 224 mm²

CURRENT PROCESSORS FOR DESKTOPS AND LAPTOPS

Intel Kaby lake (mobile)

AMD APU Ryzen

Process of 14nm, more than 10^9 transistors, TDP between 4 and 100 W, three levels of cache, integrated GPU, ...

SUPERCOMPUTERS

The top500 list in June 2021

Rank	System	Cores	Rmax (TFlop/s)	Rpeak (TFlop/s)	Power (kW)
1	Supercomputer Fugaku - Supercomputer Fugaku, A64FX 48C 2.2GHz, Tofu interconnect D, Fujitsu RIKEN Center for Computational Science Japan	7,630,848	442,010.0	537,212.0	29,899
2	Summit - IBM Power System AC922, IBM POWER9 22C 3.07GHz, NVIDIA Volta GV100, Dual-rail Mellanox EDR Infiniband, IBM DOE/SC/Oak Ridge National Laboratory United States	2,414,592	148,600.0	200,794.9	10,096
3	Sierra - IBM Power System AC922, IBM POWER9 22C 3.1GHz, NVIDIA Volta GV100, Dual-rail Mellanox EDR Infiniband, IBM / NVIDIA / Mellanox DOE/NNSA/LLNL United States	1,572,480	94,640.0	125,712.0	7,438
4	Sunway TaihuLight - Sunway MPP, Sunway SW26010 260C 1.45GHz, Sunway, NRCPC National Supercomputing Center in Wuxi China	10,649,600	93,014.6	125,435.9	15,371
5	Perlmutter - HPE Cray EX235n, AMD EPYC 7763 64C 2.45GHz, NVIDIA A100 SXM4 40 GB, Slingshot-10, HPE DOE/SC/LBNL/NERSC United States	706,304	64,590.0	89,794.5	2,528
6	Selene - NVIDIA DGX A100, AMD EPYC 7742 64C 2.25GHz, NVIDIA A100, Mellanox HDR Infiniband, Nvidia NVIDIA Corporation United States	555,520	63,460.0	79,215.0	2,646
7	Tianhe-2A - TH-IVB-FEP Cluster, Intel Xeon E5-2692v2 12C 2.2GHz, TH Express-2, Matrix-2000, NUDT National Super Computer Center in Guangzhou China	4,981,760	61,444.5	100,678.7	18,482
8	JUWELS Booster Module - Bull Sequana XH2000 , AMD EPYC 7402 24C 2.8GHz, NVIDIA A100, Mellanox HDR InfiniBand/ParTec ParaStation ClusterSuite, Atos Forschungszentrum Juelich (FZJ) Germany	449,280	44,120.0	70,980.0	1,764
9	HPC5 - PowerEdge C4140, Xeon Gold 6252 24C 2.1GHz, NVIDIA Tesla V100, Mellanox HDR Infiniband, Dell EMC Eni S.p.A. Italy	669,760	35,450.0	51,720.8	2,252
10	Frontera - Dell C6420, Xeon Platinum 8280 28C 2.7GHz, Mellanox InfiniBand HDR, Dell EMC Texas Advanced Computing Center/Univ. of Texas United States	448,448	23,516.4	38,745.9	

WHERE ELSE ARE EMBEDDED PROCESSORS FOUND?

THE COMPUTER REVOLUTION

Progress in computer technology

- Underpinned by Moore's Law

Makes novel applications feasible

- Computers in automobiles
- Cell phones
- Human genome project
- World Wide Web
- Search Engines

Computers are pervasive

MOORE'S LAW

In 1965, Intel's Gordon Moore predicted that the number of transistors that can be integrated on single chip would double about every two years

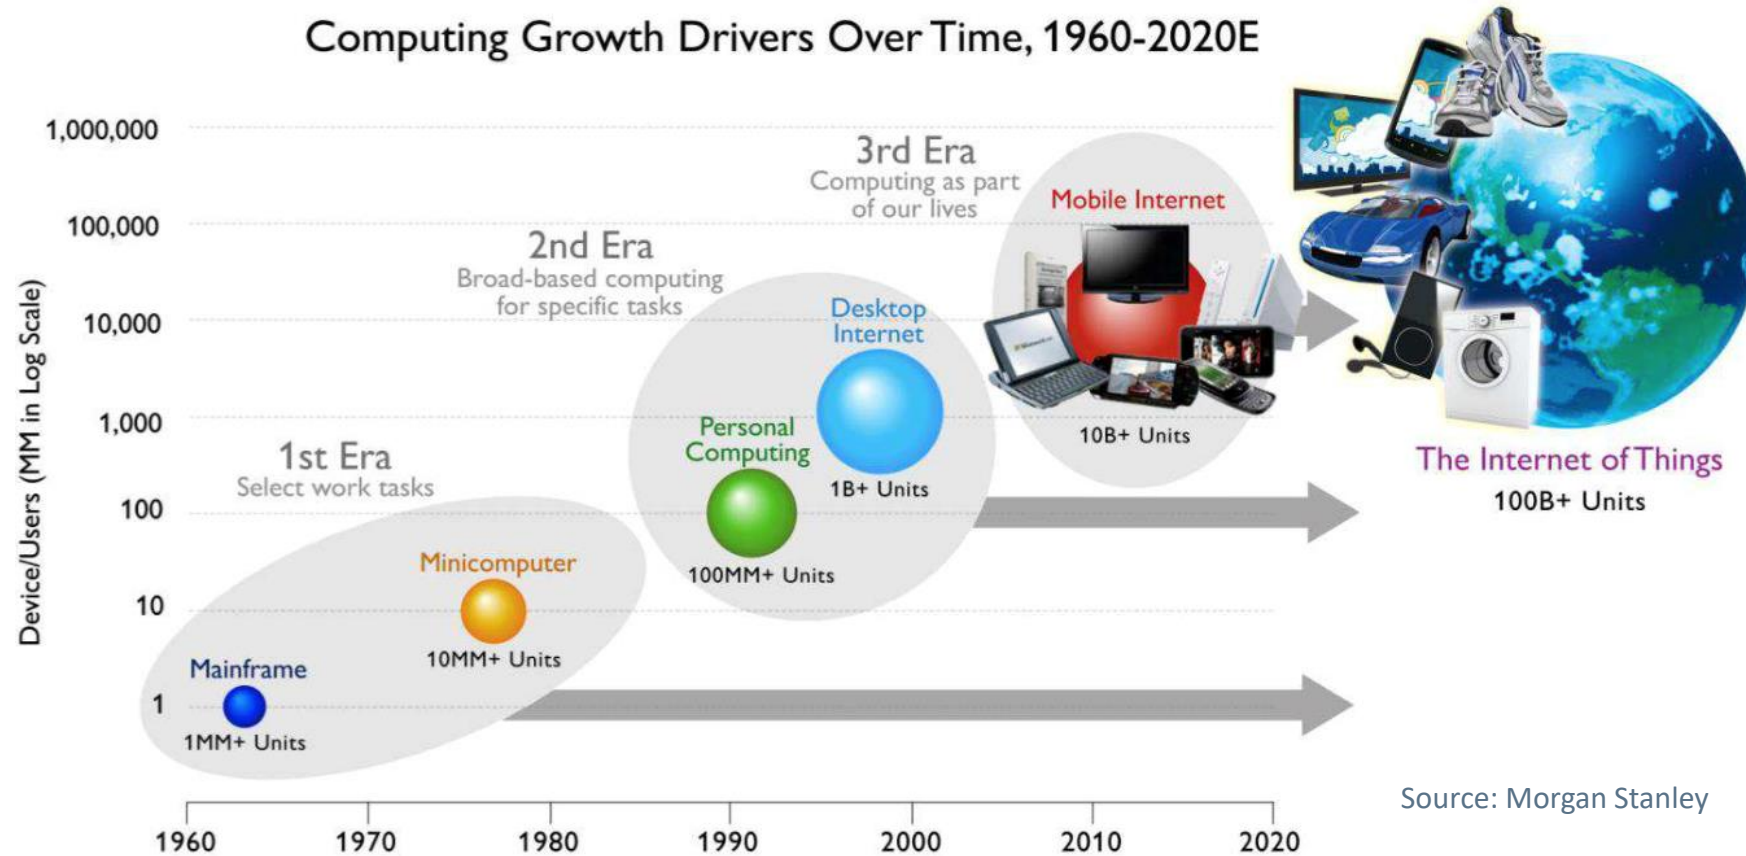

2017: Quad Core Kaby Lake
with 3.2B transistors

*Note: Vertical scale of chart not proportional to actual Transistor count.

Courtesy, Intel®

CONNECTIVITY DRIVING COMPUTING

THE PROCESSOR MARKET

Source: IDC. HPC forecast Intersect360

SMARTPHONE INDUSTRY EVOLUTION

How smartphones killed the PC

Smartphones outgrew PCs in 2011

Source: Gartner, IDC, Apple

4bn people buying
every 2 years
instead of 1.6bn
every 5 years

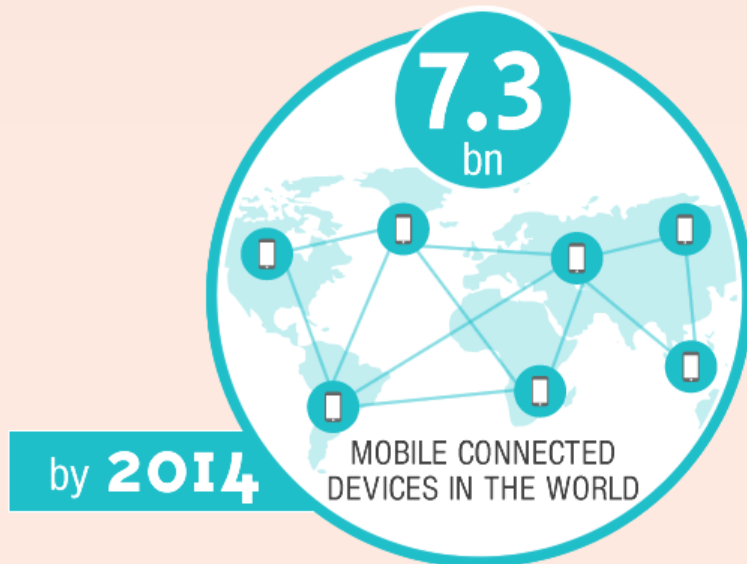

MOBILE DEVICES INCREASE

BROUGHT TO YOU BY:  **Illuminas**
Global market research

MOBILE DEVICE USAGE IS EXPLODING

➔ New age of mobile World

By **2014** there will be more **mobile-connected devices** on Earth than people

MORE
>

TECNOLOGY SHIFT

ARM has cannibalized the processor market

Source: Wikibon 2013, IDC & Gartner 2012 shipments & Wikibon 2013-2022 projections. Assumption: Apple & Microsoft migrate to successful 64-bit ARM.

WHAT WILL YOU LEARN?

How programs are translated into the machine language

- And how the hardware executes them

The hardware/software interface

What determines program performance

- And how it can be improved

How hardware designers improve performance

How software designers improve performance

- And what is parallel processing

BELOW YOUR PROGRAM

UNDER THE COVERS

BELOW YOUR PROGRAM

Application software

- Written in high-level language (HLL)

System software

- Compiler: translates HLL code to machine code
- Operating System: service code
 - Handling input/output
 - Managing memory and storage
 - Scheduling tasks & sharing resources

Hardware

- Processor, memory, Input/Output (I/O) controllers

LEVELS OF PROGRAM CODE

High-level language

- Level of abstraction closer to problem domain
- Provides for productivity and portability

Assembly language

- Textual representation of instructions

Hardware representation

- Binary digits (bits)
- Encoded instructions and data

High-level
language
program
(in C)

```
swap(int v[], int k)
{int temp;
  temp = v[k];
  v[k] = v[k+1];
  v[k+1] = temp;
}
```

Compiler

Assembly
language
program
(for MIPS)

```
swap:
    muli $2, $5, 4
    add  $2, $4, $2
    lw   $15, 0($2)
    lw   $16, 4($2)
    sw   $16, 0($2)
    sw   $15, 4($2)
    jr   $31
```

Assembler

Binary machine
language
program
(for MIPS)

```
00000000101000010000000000011000
00000000000110000001100000100001
10001100011000100000000000000000
10001100111100100000000000000100
10101100111100100000000000000000
10101100011000100000000000000100
0000001111100000000000000001000
```

ABSTRACTION

Abstraction helps us deal with complexity

- Hide lower-level detail

Instruction set architecture (ISA)

- The hardware/software interface

Application binary interface

- The ISA plus system software interface

Implementation

- The details underlying and interface

UNDER THE COVERS

Same components for all kinds of computer

- Five classic components of a computer – input, output, memory, datapath, and control

datapath + control = processor (CPU)

Input/output includes

- User-interface devices
 - Display, keyboard, mouse
- Storage devices
 - Hard disk, CD/DVD, flash
- Network adapters
 - For communicating with other computers

OPENING THE BOX

A SAFE PLACE FOR DATA

Volatile main memory

- Loses instructions and data when power off

Non-volatile secondary memory

- Magnetic disk
- Optical disk (CDROM, DVD)
- SSD
- Flash memory

TECHNOLOGY TRENDS

Electronics technology
continues to evolve

Increased capacity and
performance
Reduced cost

Year	Technology	Relative performance/cost
1951	Vacuum tube	1
1965	Transistor	35
1975	Integrated circuit (IC)	900
1995	Very large scale IC (VLSI)	2,400,000
2005	Ultra large scale IC	6,200,000,000

NETWORKS

Communication and resource sharing

Local area network (LAN): Ethernet

- Within a building

Wide area network (WAN): the Internet

Wireless network: WiFi, Bluetooth

NetFPGA 10 Gigabit Ethernet card

TECHNOLOGY SCALING ROAD MAP (ITRS)

Year	2006	2008	2010	2012	2014	2017
Feature size (nm)	65	45	32	22	14	10
Intg. Capacity (BT)	0.3	0.7	1.1	1.4	1.9	>3.2

Fun facts about 45nm transistors

- 30 million can fit on the head of a pin
- You could fit more than 2,000 across the width of a human hair

If car prices had fallen at the same rate as the price of a single transistor has since 1968, a new car today would cost about 1 cent

PROCESSOR FREQUENCY

Why processor clock rate have almost not increased in the last ten years?

POWER TRENDS

In CMOS IC technology

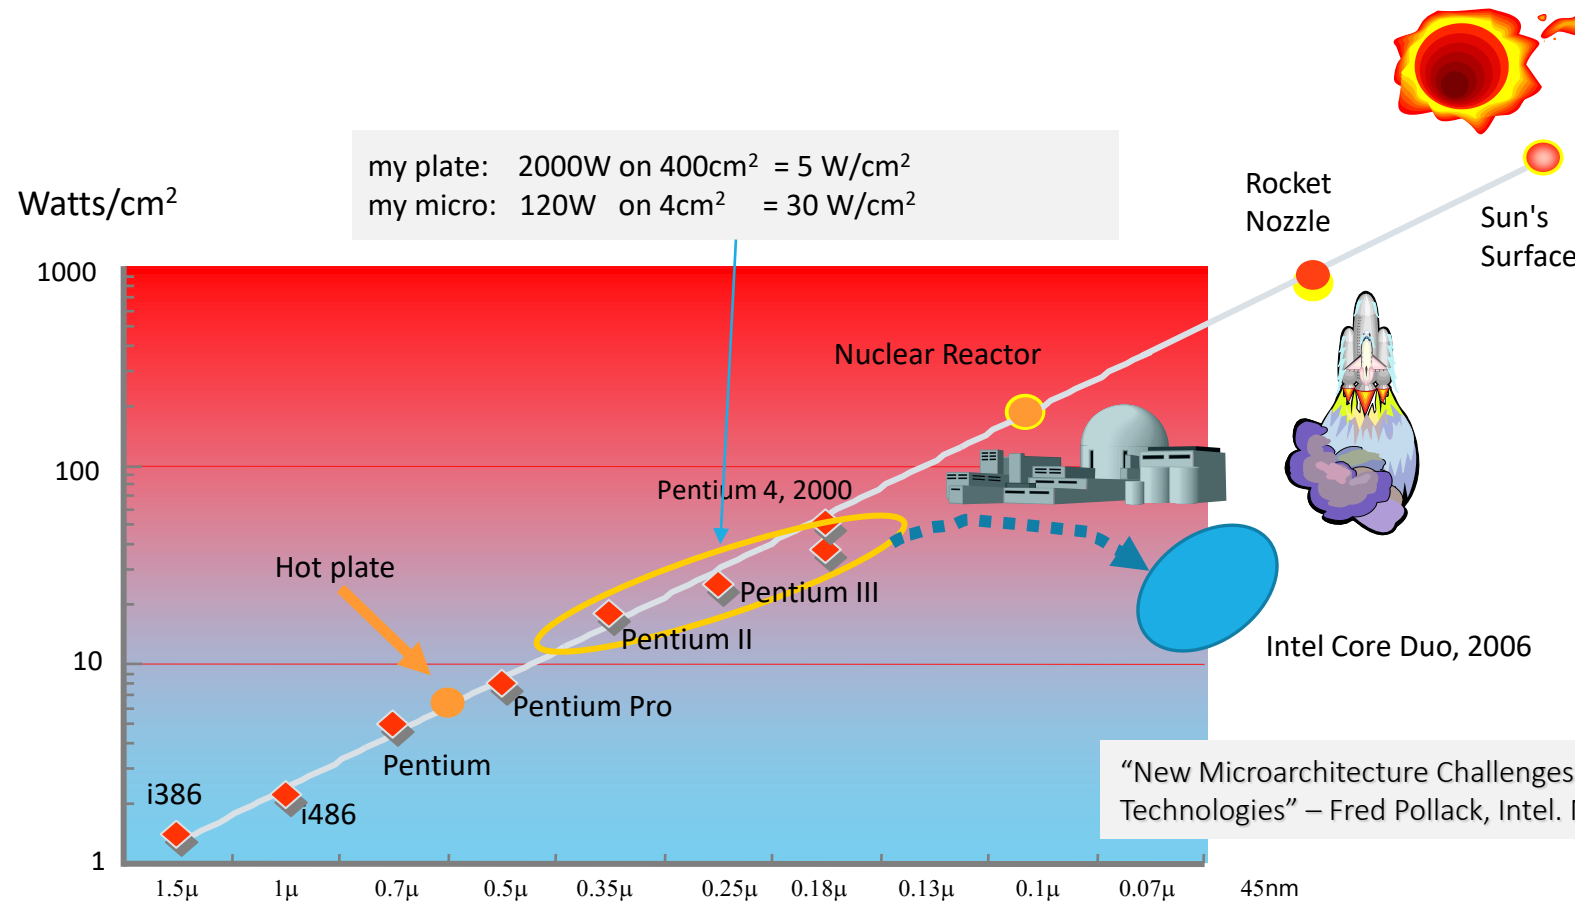

$$\text{Power} = \text{Capacitive load} \times \text{Voltage}^2 \times \text{Frequency}$$

↖
×30

↖
5V → 1V

↖
×1000

WHAT HAPPENED TO CLOCK RATES AND WHY?

REDUCING POWER

Suppose a new CPU has

- 85% of capacitive load of old CPU
- 15% voltage and 15% frequency reduction

$$\frac{P_{\text{new}}}{P_{\text{old}}} = \frac{C_{\text{old}} \times 0.85 \times (V_{\text{old}} \times 0.85)^2 \times F_{\text{old}} \times 0.85}{C_{\text{old}} \times V_{\text{old}}^2 \times F_{\text{old}}} = 0.85^4 = 0.52$$

But a power wall has been reached

- We can't reduce voltage further
- We can't remove more heat

How else can we improve performance?

UNIPROCESSOR PERFORMANCE

Constrained by power,
instruction-level parallelism,
memory latency

THE SEA CHANGE: MULTIPROCESSORS

42 Years of Microprocessor Trend Data (Feb. 15, 2018)

Original data up to the year 2010 collected and plotted by M. Horowitz, F. Labonte, O. Shacham, K. Olukotun, L. Hammond, and C. Batten
New plot and data collected for 2010-2017 by K. Rupp

MULTIPROCESSORS

Multicore microprocessors

- More than one processor per chip

Requires explicitly parallel programming

- Compare with instruction level parallelism
 - Hardware executes multiple instructions at once
 - Hidden from the programmer
- Hard to do
 - Programming for performance
 - Load balancing
 - Optimizing communication and synchronization

THE SEA CHANGE: MULTIPROCESSORS

The power challenge has forced a change in the design of microprocessors

- Since 2002 the rate of improvement in the response time of programs on desktop computers has slowed from a factor of 1.5 per year to less than a factor of 1.2 per year

As of 2006 all desktop and server companies are shipping microprocessors with multiple processors – cores – per chip

Product	AMD Ryzen	Intel Kaby Lake	Samsung Exynos Octa	Qualcomm Snapdragon
Cores per chip	4-16 + GPU	4 + GPU	4 + 4	4 + GPU +DSP
Clock rate	2.0-3.8 GHz	1.8-3.0 GHz	1.3-1.8 GHz	2.3 GHz
Power	~12-95 W	~4.5-91W	< 10 W	< 10 W

Plan of record is to double the number of cores per chip per generation (about every two years)

UNDERSTANDING PERFORMANCE

POWER, THROUGHPUT AND RESPONSE TIME

UNDERSTANDING PERFORMANCE

Algorithm

- Determines number of operations executed

Programming language, compiler, architecture

- Determine number of machine instructions executed per operation

Processor and memory system

- Determine how fast instructions are executed

I/O system (including OS)

- Determines how fast I/O operations are executed

WHY?

Purchasing perspective

- given a collection of machines, which has the
 - best performance ?
 - least cost ?
 - best cost/performance?

Design perspective

- faced with design options, which has the
 - best performance improvement ?
 - least cost ?
 - best cost/performance?

Both require

- basis for comparison
- metric for evaluation

Our goal is to compare which factors affect performances and their relative weight

RESPONSE TIME AND THROUGHPUT

Response time

- How long it takes to do a task

Throughput

- Total work done per unit time
 - e.g., tasks/transactions/... per hour

How are response time and throughput affected by

- Replacing the processor with a faster version?
- Adding more processors?

RELATIVE PERFORMANCE

Define performance as $1/ExecutionTime$

X is n times faster than Y means

$$\frac{Performance_X}{Performance_Y} = \frac{ExecutionTime_Y}{ExecutionTime_X} = n$$

Example: time taken to run a program

- 10s on A, 15s on B
- $\frac{ExecutionTime_Y}{ExecutionTime_X} = \frac{15s}{10s} = 1.5$
- So A is 1.5 times faster than B

MEASURING EXECUTION TIME

Elapsed time

- Total response time, including all aspects
 - Processing, I/O, OS overhead, idle time
- Determines system performance

CPU time

- Time spent processing a given job
 - Discounts I/O time, other jobs' shares
- Comprises user CPU time and system CPU time
- Different programs are affected differently by CPU and system performance

EXAMPLE: 'TIME' IN UNIX

CPU CLOCKING

Operation of digital hardware governed by a constant-rate clock

Clock period: duration of a clock cycle

- e.g., $250\text{ps} = 0.25\text{ns} = 250 \times 10^{-12}\text{s}$

Clock frequency (rate): cycles per second

- e.g., $4.0\text{GHz} = 4000\text{MHz} = 4.0 \times 10^9\text{Hz}$

CPU TIME

$$\begin{aligned} CPUTime &= CPUClockCycles \times ClockCycleTime \\ &= \frac{CPUClockCycles}{ClockRate} \end{aligned}$$

Performance improved by

- Reducing number of clock cycles
- Increasing clock rate
 - Hardware designer must often trade off clock rate against cycle count

CPU TIME EXAMPLE

Computer A: 2GHz clock, 10s CPU time

Designing Computer B

- Aim for 6s CPU time
- Can do faster clock, but causes $1.2 \times$ clock cycles

How fast must Computer B clock be?

$$\text{Clock Rate}_B = \frac{\text{Clock Cycles}_B}{\text{CPU Time}_B} = \frac{1.2 \times \text{Clock Cycles}_A}{6s}$$

$$\begin{aligned}\text{Clock Cycles}_A &= \text{CPU Time}_A \times \text{Clock Rate}_A \\ &= 10s \times 2\text{GHz} = 20 \times 10^9\end{aligned}$$

$$\text{Clock Rate}_B = \frac{1.2 \times 20 \times 10^9}{6s} = \frac{24 \times 10^9}{6s} = 4\text{GHz}$$

INSTRUCTION COUNT AND CPI

$$\text{ClockCycles} = \text{InstructionCount} \times \underbrace{\text{CyclesPerInstruction}}_{\text{CPI}}$$

$$\begin{aligned} \text{CPU Time} &= \text{InstructionCount} \times \text{CPI} \times \text{ClockCycleTime} \\ &= \frac{\text{InstructionCount} \times \text{CPI}}{\text{ClockRate}} \end{aligned}$$

Instruction Count for a program

- Determined by program, ISA and compiler

Average cycles per instruction

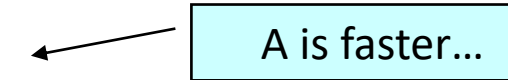

- Determined by CPU hardware
- If different instructions have different CPI
 - Average CPI affected by instruction mix

CPI EXAMPLE

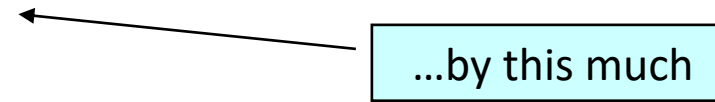

Computer A: ClocCycleTime = 250ps, CPI = 2.0

Computer B: ClockCycle Time = 500ps, CPI = 1.2

Same ISA, which is faster, and by how much?

$$\begin{aligned}\text{CPU Time}_A &= \text{Instruction Count} \times \text{CPI}_A \times \text{ClockCycleTime}_A \\ &= 1 \times 2.0 \times 250\text{ps} = 1 \times 500\text{ps}\end{aligned}$$

$$\begin{aligned}\text{CPU Time}_B &= \text{Instruction Count} \times \text{CPI}_B \times \text{ClockCycleTime}_B \\ &= 1 \times 1.2 \times 500\text{ps} = 1 \times 600\text{ps}\end{aligned}$$

$$\frac{\text{CPU Time}_B}{\text{CPU Time}_A} = \frac{1 \times 600\text{ps}}{1 \times 500\text{ps}} = 1.2$$

CPI IN MORE DETAIL

If different instruction classes take different numbers of cycles

$$ClockCycles = \sum_{i=1}^n (CPI_i \times InstructionCount_i)$$

The weighted average CPI is

$$CPI = \frac{ClockCycles}{InstructionCount} = \sum_{i=1}^n \left(CPI_i \times \frac{InstructionCount_i}{InstructionCount} \right)$$

Relative frequency

CPI EXAMPLE

Alternative compiled code sequences using instructions in classes A, B, C

Class	A	B	C
CPI for class	1	2	3
IC in sequence 1	2	1	2
IC in sequence 2	4	1	1

■ Sequence 1: IC = 5

- Clock Cycles
 $= 2 \times 1 + 1 \times 2 + 2 \times 3$
 $= 10$

- Avg. CPI = $10/5 = 2.0$

■ Sequence 2: IC = 6

- Clock Cycles
 $= 4 \times 1 + 1 \times 2 + 1 \times 3$
 $= 9$

- Avg. CPI = $9/6 = 1.5$

PERFORMANCE SUMMARY

$$\text{CPU Time} = \underbrace{\frac{\text{InstructionCount}}{\text{Program}}}_{\text{IC}} \times \underbrace{\frac{\text{Clock Cycles}}{\text{Instruction}}}_{\text{CPI}} \times \underbrace{\frac{\text{Seconds}}{\text{ClockCycleTime}}}_{\text{CC (=T}_c\text{)}}$$

Performance depends on

- Algorithm: affects IC, possibly CPI
- Programming language: affects IC, CPI
- Compiler: affects IC, CPI
- Instruction set architecture: affects IC, CPI, T_c

PITFALL: AMDAHL'S LAW

Improving an aspect of a computer and expecting a proportional improvement in overall performance

$$T_{improved} = \frac{T_{affected}}{improvement\ factor} + T_{unaffected}$$

Example: if multiply accounts for 80s of 100s,

- How much improvement in multiply performance is needed to get 5× overall?
- $\frac{100s}{5} = 20s = \frac{80}{n} + 20 \rightarrow \text{can't be done!}$

TOTAL SPEED-UP

How much speed-up is obtained by improving a part?

$$S = \frac{T_{CPU \text{ original}}}{T_{CPU \text{ improved}}} = \frac{1}{\frac{F_e}{S_e} + (1 - F_e)}$$

where F_e is the fraction of enhancement and S_e is the factor of enhancement.

TOTAL SPEED-UP

How much speed-up is obtained by improving a part?

$$S = \frac{T_{CPU \text{ original}}}{T_{CPU \text{ improved}}} = \frac{1}{\frac{F_e}{S_e} + (1 - F_e)}$$

where F_e is the fraction of enhancement and S_e is the factor of enhancement.

The opportunity for improvement is affected by how much time the modified event consumes

- Corollary 1: make the common case fast

The performance enhancement possible with a given improvement is limited by the amount the improved feature is used

- Corollary 2: the bottleneck will limit the improvement

PITFALL: MIPS AS A PERFORMANCE METRIC

MIPS: Millions of Instructions Per Second

$$MIPS = \frac{InstructionCount}{ExecutionTime \times 10^6} = \frac{ClockRate}{CPI \times 10^6}$$

Doesn't account for

- Differences in ISAs between computers
- Differences in complexity between instructions

SPEC CPU BENCHMARK

Programs used to measure performance

- Supposedly typical of actual workload

Standard Performance Evaluation Corp (SPEC)

- Develops benchmarks for CPU, I/O, Web, ...

SPEC CPU2006

- Elapsed time to execute a selection of programs
 - Negligible I/O, so focuses on CPU performance
- Normalize relative to reference machine
- Summarize as geometric mean of performance ratios
 - CINT2006 (integer) and CFP2006 (floating-point)

$$\sqrt[n]{\prod_{i=1}^n ExecutionTimeRatio_i}$$

SPEC CPU 2017

Since July 2017 a new benchmark is available

- A new metric, SPECrate, is added
 - Former metric is called SPECspeed
- It includes 4 new suites:
 - Pairs of int/fp with speed/rate
 - Base and peak metrics can be chosen

Name	Description	IC×10 ⁹	CPI	Tc (ns)	Tcpu(s)	Ref time(s)	SPECratio

FALLACY: LOW POWER AT IDLE

Look back at X4 power benchmark

- At 100% load: 295W
- At 50% load: 246W (83%)
- At 10% load: 180W (61%)

Google data center

- Mostly operates at 10% – 50% load
- At 100% load less than 1% of the time

Consider designing processors to make power proportional to load

CONCLUDING REMARKS

Cost/performance is improving

- Due to underlying technology development

Hierarchical layers of abstraction

- In both hardware and software

Instruction set architecture

- The hardware/software interface

Execution time: the best performance measure

Power is a limiting factor

- Use parallelism to improve performance

EXERCISES

Find the clock rate (in MHz) required for a processor taking into account that the execution of a program takes $9.4 \mu\text{s}$, the number of cycles per instruction is 4.6 and the instruction count is 540 (note: in case of having a decimal value, please write only the integer part; for example, if the solution is 4.7, you should write 4)

EXERCISES

The ISA of a processor has four classes of instructions: arithmetic, store, load and branch with CPI 2, 2, 4, 2.0 respectively. Assume a program composed by 412 arithmetic operations, 341 stores, 104 loads and 488 branches. What is the execution time of the program in a 2.4 GHz processor? Give the result in microseconds (μs).

EXERCISES

Find the number of mips produced by a program with a CPI of 6.0 assuming a frequency of 3.2 GHz for the processor (give the result with one decimal; for example, if we have 78.56 I will write 78.5)

EXERCISES

Find the speed-up of a processor in which we have improved the ALU. With the new ALU, the speed-up of the arithmetic-logic operations is 37% (the remaining instructions -no arithmetic instructions- keep the same speed). We also know that the 24% of the computation time is dedicated to arithmetic-logic operations in the original processor (give the answer using two decimals).

EXERCISES

Find the instruction count (IC) in the execution of a program which takes $38 \mu\text{s}$. We know that the average number of cycles per instruction (CPI) is 2.1 and that the processor works at 191 MHz (note: if a decimal value is obtained in the result, please write only the integer part; for example, if the solution is 3.6, you will write 3).

EXERCISES

Find the average number of cycles per instruction in the execution of a program which takes $19\text{ }\mu\text{s}$ to be executed, and taking into account that the number of executed instructions (instructions count) is 5386 with a processor working at 985 MHz (give the solution with only one decimal).

EXERCISES

We want to evaluate the performance of a new computer. To do that, we use the SPEC CPU benchmark. The following table shows the number instructions executed by different benchmarks of SPECint2006 as well as the CPI for the execution of each benchmark in the new computer. The clock rate of the new computer is 2.0 GHz.

How many times is the new computer faster than the reference machine?

Notes: for the reference machine use the values that appear in the class slides; provide the geometric mean with at least two decimals

Program	IC x 10 ¹¹	CPI
Perl	9.5	2.0
Bzip2	8.6	4.3
Gcc	1.9	1.7
Mcf	4.3	2.0
Go	6.6	0.7
Hmmer	7.8	1.4
Sjeng	8.8	0.7
Libquantum	7.0	0.9
H264avc	1.2	1.0
Omnetpp	9.0	1.9
Astar	2.4	0.6
xalancbmk	5.8	1.7
